

1.) Japan's MOL and KEPCO ink agreement for liquefied hydrogen carrier study

SINGAPORE, Nov 19 (Reuters) - Japan's Mitsui O.S.K. Lines (9104.T), opens new tab and Kansai Electric Power Company (9503.T), opens new tab have signed a memorandum of understanding (MoU) for the joint study of a liquefied hydrogen carrier, the companies said in a joint statement on Tuesday.

This is the first agreement in Japan between a shipping company and a power generation company for marine transport of liquefied hydrogen, as they work towards establishing a hydrogen supply chain. The companies will study and review optimal vessels and operations in the liquefied hydrogen supply chain, the safety of such vessels, as well as international laws and regulations related to the marine transport of liquefied hydrogen.

2.) Singapore LNG signs deal with Japan's Mitsui OSK Lines for second LNG terminal

SINGAPORE, Oct 23 (Reuters) - Singapore LNG Corporation (SLNG) has agreed to charter from a unit of Japan's Mitsui O.S.K. Lines (MOL) (9104.T), opens new tab a newly built floating storage and regasification unit (FSRU) as the island nation's second import terminal for liquefied natural gas (LNG).

SLNG, which operates Singapore's sole LNG terminal, said on Wednesday that the new terminal, or FSRU, was expected to start operations by the end of the decade.

It will be built by South Korean shipbuilder Hanwha Ocean and have a storage capacity of 200,000 cubic meters and a regasification capacity of 5 million tons per annum (mtpa), SLNG said.

MOL said in a separate statement that it would own, manage and operate the FSRU after delivery, which is scheduled for 2027.

Singapore's current terminal on Jurong Island has an annualised average gas supply capacity of 9 mtpa, with a peak capacity of around 11 mtpa.

The second terminal will be berthed at Jurong Port and infrastructure will be developed to connect the FSRU to onshore pipelines and Singapore's gas pipeline network, SLNG said.

SLNG had said in October last year that it would develop and operate Singapore's second LNG import terminal to better enable the country's natural gas demand to be met entirely by LNG.

3.) Global consortium pioneers ammonia cargo transfer between ships at Australian port

SINGAPORE, Sept 19 (Reuters) - Japan's Mitsui O.S.K. Lines, Norway's Yara and Singapore's Global Centre for Maritime Decarbonisation said they had jointly completed an ammonia cargo transfer operation in Australia that will pave the way for ammonia bunkering in the region.

Ammonia is one of several alternative fuels that shipping companies are exploring to reduce carbon emissions, though its bunkering infrastructure is still in preliminary development.

The Pilbara region in Australia's northwest is expected to become an ammonia bunkering hub in the future due to the Dampier port's experience with exporting ammonia, Mitsui O.S.K Lines (9104.T), opens new tab said in its statement.

The trial was conducted to simulate bunkering conditions at the Dampier port, an ammonia production region, and marked the world's first ship-

to-ship transfer of ammonia to have taken place for vessels at anchorage, the companies said this week.

"The successful ship-to-ship transfer of ammonia is a critical learning step forward in enabling ammonia bunkering operations in a port environment as global shipping moves to effective use of clean ammonia as a fuel," said Murali Srinivasan, senior vice president and commercial head at Yara (YAR.OL), [opens new tab](#).

During the trial, two ship-to-ship transfers consisting of 4,000 cubic meters of ammonia took place between a gas carrier owned by Mitsui O.S.K Lines and another carrier owned by Navigator Gas.
